Stability Capitalism

A Framework for AI Transition Economics

THE PROBLEM

AI is not a future disruption. It's happening now. Through 2025, U.S. employers announced 1.17 million job cuts, a 54% jump over 2024 and the highest since 2008. 60% of layoffs hit workers 45 and older, during peak earning years. Only half land comparable roles. The rest take pay cuts or leave the workforce entirely.

Retraining programs run on multi-year timelines. Displacement runs on quarters. Our policy infrastructure was built for temporary downturns, not structural elimination of cognitive work.

The cost of automation hasn't disappeared. It migrated. From wages to cloud compute fees at AWS, Azure, Google Cloud — providers operating at 60–75% gross margins. The gain concentrates. The disruption disperses. Stability Capitalism makes that reallocation visible and redirects a fraction of it.

THE MECHANISM

An industry-funded insurance premium, collected as automation replaces labor. Every commercial AI inference processed through a cloud API is already metered and billed. We add a fraction of a penny to that existing transaction, collected upstream, automatically, at the infrastructure layer. No new compliance architecture. No new bureaucracy

Why not corporate taxes? Corporate taxes hit profit after the fact. This fee is assessed at the point of displacement. Precision economics, not blunt redistribution. Revenue scales with AI adoption. The more automation displaces labor, the more the fund grows.

THE AI DIVIDEND

A monthly income floor, not a handout. Proceeds flow to a sovereign fund modeled on the Alaska Permanent Fund, which distributes a monthly AI Dividend to eligible Americans.

At maturity: $3,000/month, tax-free, for individuals earning under $80K. Phases out gradually to $120K. No cliff effects. Each adult receives their own payment.

Social Security: No cuts. Ever. Seniors below the $3,000 floor receive a top-up only. Earned benefits remain fully intact.

Year 1: Launches at $2,000/month for the under-$50K cohort. Scales to full maturity by Year 4 as inference volume and fund growth allow.

OBJECTIONS, ANSWERED

"People will stop working." Every UBI-style pilot run shows no work reduction, & higher entrepreneurship

"It will cause inflation." Alaska has run a cash dividend for 40 years with near-zero CPI impact. The only real risk is housing, addressed directly through Land Value Tax, YIMBY reform, and rent spike caps.

"Corporations will flee." Economically difficult to avoid at scale. Open-source and on-premise models are excluded by design. Exiting the U.S. market means forfeiting its largest customer base.

"This is socialism." Alaska has paid dividends from shared natural resources for four decades. No worker taxes. No wealth seizure. No nationalization. The market funds its own stability layer

"Why not just tax corporations?" Corporate taxes lag automation decisions by years and invite accounting manipulation. This fee prices labor displacement at the moment it occurs: precise, automatic, unavoidable.

WHAT THE EVIDENCE SHOWS

Alaska Permanent Fund (40 years): No inflation spike, stable prices, stronger household resilience.

Stockton SEED / Kenya GiveDirectly: No reduction in work. Increased entrepreneurship, improved health outcomes, higher family stability.

U.S. Child Tax Credit (2021): 26% reduction in child poverty. Highest birth intentions in 15 years, strongest among adults 18 to 29.

South Korea baby bonus data: 10% income increase correlates with 0.4–0.6% fertility increase.

MACRO OUTCOMES

Consumer spending in the bottom 60% rises 8–12%, producing a 1.5–2.1% annual GDP lift. Fewer ER visits. Lower property crime. Local economies regenerate. The system is counter-cyclical: when layoffs increase, AI adoption accelerates, which grows the fund.

REVENUE SENSITIVITY

That insurance premium — a fraction of a penny per inference — scales automatically with actual AI usage. The revenue math:

Example: A firm replaces 100 analysts with AI, generating 10M daily inferences. At the baseline fee, that flows ~$3,300/day into the fund while payroll drops $8–12M/year. Scaled economy-wide, the math becomes visible.

Scenario	Growth	Full $3K Floor	2035 Revenue
Conservative	30% CAGR	Year 7 (2033)	~$12–15T
Moderate	40% CAGR	Year 4 (2030)	~$21–22T
Aggressive	50% CAGR	Year 3 (2029)	~$35–40T

Open-source and on-premise models excluded. Only commercial cloud API usage in scope. Viability holds under every scenario.

CONVERGENCE — APRIL 2026

OpenAI's April 6 industrial policy document calls for a Public Wealth Fund giving every American a stake in AI growth, modeled on Alaska's Permanent Fund. Elon Musk has floated 'universal high income' funded by AI productivity. Nobel Laureate Joseph Stiglitz warns unmanaged AI will deepen inequality.

This framework has been publicly documented on GitHub since November 2025 — with full collection mechanics, Ohio pilot design, and economic modeling.

OpenAI's sketch identifies the destination. Stability Capitalism provides the map

"We only need a tiny piece of AI to build the foundation of the future."
